Advocate: Feeding Tube Awareness Week

Many preemies have a feeding tube during the NICU stay as they work toward eating orally. And many also go home on feeding tubes. **February 8-14 2015 is Feeding Tube Awareness Week** brought to you by the **Feeding Tube Awareness Foundation**. Learn more, and get great resources and inspiration by going to their website at: <http://www.feedingtubeawarenessweek.org>

Preemie Resource: Milestone Log

PreemieWorld provides a number of free handouts to be used in the **NICU and beyond** in its "Freebies For You" section of the website.

This month's freebie is "Milestone Log." "Seeing the pediatrician for check-ups can require some prep by preemie parents," comments Deb Discenza, co-Founder of PreemieWorld, LLC. "We created this

milestone log for them to keep on their fridge and complete between check-ups. Then all they have to do is bring the completed paperwork in with them." Parents and professionals alike will appreciate this freebie in that it is easy to print and reproduce.

Term: Developmental Delay

Developmental Delay: Babies are expected to reach certain milestones (i.e. walking and talking) within a predictable amount of time. Premies, due to their early birth and subsequent medical challenges may take longer to reach those milestones. Many premies receive occupational therapy and/or physical therapy to deal with all of the various issues of being born too early – the stress it puts on the muscles, the stiffness in the bodies of infants

that are on the vent for any length of time, etc. This therapy is very important for your baby. If your baby is on the ventilator, ask your nurse to get an occupational therapy (OT)/physical therapist (PT) consultation. Some infants receive therapy early on after discharge, others do not require it and the parents can take a “wait and see” approach. Your pediatrician can guide you through this and may refer you to your area’s Early Intervention Program.

After the NICU:

Approaching the Pediatrician on Delays

While many pediatricians will take a "wait and see" approach to your child's development, it is okay to disagree. How to prep for that discussion at check-up time:

- Bring a developmental log – we have developed a great one for you: <http://bit.ly/milestonelog>
- Bring other observations – grandparents, teachers, child care, but make sure you get it in writing.
- Proactive vs. Reactive: Be clear to the doctor that you are an expert of your child and that you are connected in the preemie parent community where the proactive approach is always stressed over the reactive approach. *Research shows this approach is always better.*

Q & A: Advice for Parents & Pros Regarding Premies

Saroj Saigal, MD, FRCP (C), Professor Emerita Pediatrics at McMaster University and Pediatrician in their Neonatal Follow-Up Program has written Premie Voices, (review p.3) which details the outcomes of very premature infants now, in their 30s, in their own writing. We asked her for advice . . .

What would you like for parents to know?

Infants respond remarkably to being at home and thrive on parental interaction. At school, the incidence of learning problems is 2-3 times more common in very premature infants compared to infants born at term. As they grow older, some children may face math difficulties, and a higher proportion will require special education assistance.

Follow us on FB, Twitter & LinkedIn!

However the majority of premature infants graduate from high school, and many even go onto post-secondary education. Learning difficulties in premature infants are challenging, both for the children and their parents. Encouragement and a positive attitude are essential.

What would you like professionals to know?

Until recently, not much was known about how very premature children fared in their roles and responsibilities as young adults. We now know that despite the earlier development lags and disabilities, the majority of very premature children are very resilient, and function surprisingly better than we had expected.
